Editor-in-Chief
Advanced Engineering Informatics

Dear Editor,

Please find enclosed our manuscript "Coverage-controlled learning of connection-invariant magnetic surrogates for reconfigurable electric machines" for consideration as a research paper in Advanced Engineering Informatics.

Reconfigurable windings are an established route to wide-speed-range, high-efficiency electrified powertrains, yet candidate connections are usually evaluated with dedicated FE models or flux-map tables. Our manuscript addresses this with one idea: a winding connection is a set of linear constraints on coil currents, so a single connection-invariant surrogate—trained once on coil-level FE data—can query unseen connections; coverage determines when zero-shot transfer is reliable. We think this fits the journal's scope in three specific ways: (i) it is an engineering-informatics method (learned surrogates embedded in design and operation workflows) rather than a new machine or a new controller; (ii) it comes with a reproducible benchmark—seven hold-out connections, three difficulty tiers, 9,276+ nonlinear FE samples and fixed splits—released with code and data; and (iii) it delivers actionable engineering findings, including two data-collection principles, a quantified physical-consistency advantage of co-energy surrogates, and an honest negative drive-cycle result. A 105-point voltage/gear sweep found no case in which reconfiguration created feasibility. Energy gains appear only in constrained designs (24 cases, 1–2.77 %); the nominal WLTC schedule is energy-neutral. An independent FEMM cross-check limits the claims explicitly, while supporting end-to-end torque $R^2 = 0.89$–0.92 on three unseen connections.

All results in the manuscript are reproducible from the released code and data with one command per figure; the FE reference data, trained models, and benchmark splits are included. The work has not been published elsewhere and is not under consideration elsewhere. The authors declare no competing interests.

We suggest the following potential reviewers with relevant expertise: [3–6 suggested reviewers with affiliations and emails].

Thank you for your consideration.

Sincerely,

[Author Name]
